

Why the design of a space determines its value — and what most developers get wrong.

- Buyer Education
- Design Philosophy

Environmental psychology applied to residential development. How natural light, green corridors, community layout, and pathway design affect the daily experience of living in a space — and therefore its long-term value and resale appeal. Draws on published research. Explains the specific design decisions at Oltraya Verde and why they were made. Written by Chandni Rav — the behavioural science background gives this article genuine authority that no generic marketing copy can replicate.

FAQs

Q: What is environmental psychology in real estate?

A: The study of how the design of built environments affects human behaviour, wellbeing, and quality of life.

Q: Does plot orientation matter when buying land?

A: Yes significantly. East or northeast facing plots receive morning light, which research consistently associates with better sleep quality and wellbeing. Ask your developer for the orientation specifications of available plots.

Q: What is a green corridor in residential development?

A: A planned landscaped pathway or planting strip that connects open spaces within a development. Green corridors reduce ambient temperature, reduce noise, and create natural community gathering points.
